Doświadczenie w pracy z doktorantami (obronione doktoraty, otwarte przewody), chronologicznie	<p>Significance of <i>Fusarium verticillioides</i> (Saccardo) Nirenberg in etiology of Fusarium ear rot, (defense date: 27-09-2012)</p> <p>Mating type characteristic and factor analysis affected perfect stage development of <i>Fusarium fujikuroi</i> species complex. (defense date: 25-06-2019)</p>

Dorobek projektowy/grantowy (z ostatnich 10 lat)	<p>MNIiSW (N N310 440038); lata 2010 – 2013 (25.06.2010 – 24.06.2013). Biological activity of hiperparasite and epifitic bacteria against rust fungi, main contractor</p> <p>Warsaw Plant Health Initiative. UE 7Framework Programme, REGPOT Grant (No286093), 2011 – 2014, leader of work package</p> <p>NCBiR (Wniosek Nr 178857); 2012 – 2015. Development of molecular markers devoted to effective selection of common rye (<i>Secale cereale L.</i>) with resistance to diseases and pre-harvest sprouting, cooperator</p> <p>MRIiRW 2015 – 2019 Fusarium temperatum significance and harmfulness in maize production, <i>F. temperatum</i> searching for sources of resistance and their characteristic, leader (2015-2016), main contractor (2017-2019)</p> <p>NCN 2018/31/B/NZ9/00439; 2019 -2022, Identification, characterization and mapping of rye (<i>Secale cereale L.</i>) genes related to resistance to brown rust caused by <i>Puccinia recondita f. Sp. Secalis</i>, contractor</p>
Zakres tematyczny – problem badawczy – do rozwiązania którego poszukuje się doktoranta	<p>Transgression in fungi, occurrence and significance the phenomenon among selected Ascomycota species.</p> <p>The phenomenon of transgressive segregation is results of sexual crossing. Individuals created in this process may achieve the features that go beyond the range of variability of the parent phenotypes. Moreover the acquired features are stable over time. Persistence of the acquired new traits significantly distinguishes this process from heterosis.</p> <p>The transgression phenomenon is common in plants and animals, and it has been recognized to a very limited extent in microorganisms, including fungi. Phenotypes with extreme traits arising from transgression may play an important role in evolution. The aim of the research work will be generation of hybrid generation isolates for selected Ascomycota species and their phenotypic and molecular characteristics in terms of the transgression of selected traits.</p>
